

PROJECT DOCUMENTATION

CUSTOMER SUPPORT TICKET PRIORITY PREDICTION AND AUTOMATED ASSIGNMENT SYSTEM USING AGENTFORCE

1. INTRODUCTION

Customer support teams handle a large number of tickets every day. Manually reviewing and prioritizing these tickets can consume time and may result in urgent issues being overlooked.

The Customer Support Ticket Priority Prediction and Automated Assignment System Using Agentforce provides an automated Salesforce-based solution for identifying ticket priority and supporting faster ticket handling.

The project combines Salesforce custom objects, Salesforce Flow, Tasks, and Agentforce to automate the support ticket prioritization process.

2. PROJECT OBJECTIVE

The main objective of this project is to develop an intelligent customer support solution that can:

- Analyze customer support tickets.
- Identify the priority of each ticket.
- Classify tickets into High, Medium, or Low priority.
- Automatically create tasks for critical tickets.
- Assign high-priority tickets to a senior support agent.
- Provide ticket analysis through Agentforce.
- Reduce manual effort for support teams.

3. PROBLEM STATEMENT

In a traditional customer support environment, support agents may manually review every ticket to determine its priority. This creates several challenges such as delayed urgent-ticket

identification, manual effort, inconsistent prioritization, and reduced visibility into critical cases.

4. PROPOSED SOLUTION

The proposed system stores customer support information in Salesforce and automatically analyzes the latest support ticket associated with a customer account.

The system evaluates the ticket description using predefined keywords and determines the appropriate priority: High, Medium, or Low.

For High-priority tickets, the system automatically creates an urgent task and assigns the ticket to a Senior Support Agent. Agentforce provides a conversational interface through which the user can request ticket analysis.

5. SYSTEM ARCHITECTURE

Agentforce

|

Priority + Status Message

6. SALESFORCE CUSTOM OBJECT

Support Ticket Intelligence

API Name: Support_Ticket_Intelligence__c

This object stores customer support ticket information required for analysis and prioritization.

FIELD	PURPOSE
Ticket Number	Unique ticket identification
Customer	Links the ticket to an Account
Contact	Identifies the customer contact
Issue Type	Defines the type of issue
Description	Contains the customer's issue details
Priority Level	Stores High, Medium, or Low
Status	Tracks ticket status
Assigned To	Identifies the responsible support agent
Resolution Time	Stores ticket resolution information
SLA Breach Risk	Indicates potential SLA risk

7. PRIORITY CLASSIFICATION

PRIORITY	EXAMPLES	RESULT
High	Urgent; Not working; Failure	Immediate attention; urgent task; senior agent
Medium	Issue; Slow; Delay	Medium priority
Low	Other/general requests	Low priority

8. ANALYZE SUPPORT TICKET FLOW

The Salesforce Flow named Analyze Support Ticket performs the main ticket analysis.

Flow Input: varAccountName

- Receive customer account name.
- Retrieve the Account record.
- Retrieve the customer's support ticket.
- Read ticket information.
- Evaluate ticket conditions.
- Determine High, Medium, or Low priority.
- Create an urgent task for High priority.
- Assign the ticket to the Senior Support Agent.
- Return the priority and status message.

9. AUTOMATED TASK CREATION

When a ticket is classified as High priority, the system automatically creates a Salesforce Task.

TASK ATTRIBUTE	VALUE
Subject	Urgent Ticket Handling
Priority	High

TASK ATTRIBUTE	VALUE
Status	Not Started
Assignment	Senior Support Agent

10. AGENTFORCE INTEGRATION

Agentforce is used as the conversational interface for support ticket analysis. The Agentforce action invokes the Analyze Support Ticket functionality.

Action: Support Ticket Intelligence

Purpose: Analyze the customer's available support ticket information and return ticket priority and a short status message.

11. AGENTFORCE ACTION INSTRUCTIONS

The Agentforce action analyzes the customer's support ticket using available information and the Analyze Support Ticket action. It returns only the ticket priority and a short status message, and does not request additional ticket details when required account information is already available.

12. EXAMPLE DEMONSTRATION

Customer: Test Customer Account

Ticket Description: Payment is not working and this is urgent.

Detected indicators: Not working; Urgent

Priority: High

Automated Action: Urgent Ticket Handling → Senior Support Agent

Agentforce Response: High priority ticket detected. Assigned to senior agent.

13. USER PERSONAS

PERSONA	REQUIREMENT
PS-1 – Support Agent	Identify critical tickets quickly and handle urgent customer problems first.
PS-2 – Customer	Expect urgent issues to receive appropriate attention.
PS-3 – Support Manager	Need visibility into ticket priorities and critical cases.
PS-4 – Support Agent	Benefit from automated classification.
PS-5 – Support Manager	Monitor high-priority tickets and ensure appropriate assignment.

14. BENEFITS

- Faster prioritization.
- Reduced manual work.
- Better handling of critical tickets.
- Consistent classification.
- Improved support efficiency.
- Agentforce-assisted analysis.

15. PROJECT IMPLEMENTATION

- Salesforce custom object creation.
- Custom field configuration.
- Support ticket data creation.
- Salesforce Flow development.
- Priority classification logic.
- Automated Task creation.
- Agentforce action configuration.
- Agentforce testing.

- Final output validation.

16. TESTING

Test Customer: Test Customer Account

Issue: Payment is not working and this is urgent.

Expected Result: High priority

Actual Result: High priority

Status: High priority ticket detected. Assigned to senior agent.

The expected and actual results are consistent.

- Flow.png – Analyze Support Ticket automation and priority logic.
- Agentforce.png – Agentforce configuration and support ticket analysis action.

- Demo_Output.png – Final Agentforce output.

19. FUTURE ENHANCEMENTS

- AI-powered sentiment analysis.
- Machine-learning-based priority prediction.
- Automatic SLA breach prediction.
- Agent availability-based assignment.
- Email and SMS notifications.
- Multilingual support.
- Historical ticket analysis.
- Customer sentiment tracking.
- Advanced Agentforce recommendations.
- Integration with external CRM and help-desk systems.

20. CONCLUSION

The project demonstrates how Salesforce automation and Agentforce can be combined to improve customer support operations.

The solution automatically identifies ticket priority, creates urgent tasks for critical issues, assigns high-priority tickets to a senior support agent, and provides a concise response through Agentforce.

The project helps reduce manual effort, improve response efficiency, and ensure that critical customer issues receive appropriate attention.
